certain upgrades and changes which should be interesting for you. Please remember that our website does not replace publisher websites, there would be no point in duplicating the information. Our idea is to present you with tools that might be useful in your work with individual, institutional and corporate customers. Many of the features have been introduced at specific requests from some of you. Others are still at preparatory stage and will be implemented soon.

Classical Galois Theory With Examples

Classical Galois Theory deals, in essence, with the solutions to polynomial equations. Its applications are spectacular, including the algebraic result that some polynomial equations of degree ≥ 5 can't be solved in radicals, and the geometrical result that the cube can't be doubled by ruler-and-compass constructions.

Classical Galois theory, with examples : Gaal, Lisl, 1924 ...

Galois theory is considered one of the most beautiful subjects in mathematics, but it is hard to appreciate this fact fully without seeing specific examples. Numerous examples are therefore included throughout this text, in the hope that they will lead to a deeper understanding and genuine appreciation of the more abstract and advanced literature on Galois theory.

Galois theory. Classical results by Abel, Gauss, Kronecker, Lagrange, Ruffini, and, of course, Galois are presented as background and motivation leading up to a modern treatment of Galois theory. The celebrated criterion due to Galois for the solvability of polynomials by radicals is presented in detail. The power of

For example, in algebraic number theory, one often does Galois theory using number fields, finite fields or local fields as the base field. It allows one to more easily study infinite extensions. Again this is important in algebraic number theory, where for example one often discusses the absolute Galois group of \mathbb{Q} , defined to be the Galois group of K / \mathbb{Q} where K is an algebraic closure of \mathbb{Q} .

Examples. Given a field K , the multiplicative group $(K^s)^\times$ of a separable closure of K is a Galois module for the absolute Galois group. Its second cohomology group is isomorphic to the Brauer group of K (by Hilbert's theorem 90, its first cohomology group is zero).; If X is a smooth proper scheme over a field K then the ℓ -adic cohomology groups of its geometric fibre are Galois modules for ...
